INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference PD990017	FOR FURTHER ACTION see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.	
International application No. PCT/EP 00/02439	International filing date (day/month/year) 17/03/2000	(Earliest) Priority Date (day/month/year) 01/04/1999
Applicant DEUTSCHE-THOMSON-BRANDT GMBH		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 2 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

- a. With regard to the **language**, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.

the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).

- b. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international search was carried out on the basis of the sequence listing :

contained in the international application in written form.

filed together with the international application in computer readable form.

furnished subsequently to this Authority in written form.

furnished subsequently to this Authority in computer readable form.

the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.

the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished

2. ☐ **Certain claims were found unsearchable** (See Box I).

3. ☐ **Unity of Invention is lacking** (see Box II).

4. With regard to the **title**,

the text is approved as submitted by the applicant.

the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

the text is approved as submitted by the applicant.

the text has been established, according to Rule 38 2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the **drawings** to be published with the abstract is Figure No.

as suggested by the applicant.

because the applicant failed to suggest a figure.

because this figure better characterizes the invention.

1

None of the figures.

Priority date (day/month/year)
01/04/1999

Applicant

DEUTSCHE-THOMSON-BRANDT GMBH et al.

1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT**

International application No. PCT/EP00/02439

I. Basis of the report

1. With regard to the **elements** of the international application (*Replacement sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to this report since they do not contain amendments (Rules 70.16 and 70.17)*):

Description, pages:

1-11 as originally filed

Claims, No.:

1-8 as originally filed

Drawings, sheets:

1/2-2/2 as originally filed

2. With regard to the **language**, all the elements marked above were available or furnished to this Authority in the language in which the international application was filed, unless otherwise indicated under this item.

These elements were available or furnished to this Authority in the following language: , which is:

- ☐ the language of a translation furnished for the purposes of the international search (under Rule 23.1(b)).
- ☐ the language of publication of the international application (under Rule 48.3(b)).
- ☐ the language of a translation furnished for the purposes of international preliminary examination (under Rule 55.2 and/or 55.3).

3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international preliminary examination was carried out on the basis of the sequence listing:

- ☐ contained in the international application in written form.
- ☐ filed together with the international application in computer readable form.
- ☐ furnished subsequently to this Authority in written form.
- ☐ furnished subsequently to this Authority in computer readable form.
- ☐ The statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
- ☐ The statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished.

4. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
- ☐ the claims, Nos.:

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT**

International application No. PCT/EP00/02439

☐ the drawings, sheets:

5. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

6. Additional observations, if necessary:

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N)	Yes: Claims 1-8
	No: Claims
Inventive step (IS)	Yes: Claims 1-8
	No: Claims
Industrial applicability (IA)	Yes: Claims 1-8
	No: Claims

2. Citations and explanations
see separate sheet

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:
see separate sheet

Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

The international application relates to a method for the compilation of bus packets for isochronous data transmission via a data bus and to an apparatus for carrying out said method.

As it is known from the prior art (IEC 61883) throughout isochronous data transmission CIP (common isochronous packet) headers are added to the beginning of each bus packet after the bus packet header in order to enable the receiving station to correctly evaluate the data of received packets. During the transmission the CIP headers of consecutive bus packets must be updated in the DBC (data block counter) section. In the bus interface the CIP header of a bus packet has to be present twice, i.e. one for a completely compiled bus packet and another one in order to create the CIP header of a succeeding packet while new data is provided by the application process.

In order to cope with aforementioned difficulties, prior art systems for performing isochronous data transmissions provide two separate special registers for storing CIP headers and a buffer memory for storing the data of respective bus packets. A selection unit is provided for reading the correct CIP header from one of the two special registers. Said selection unit transfers said data to a data transmitting unit at the correct point of time, fetches the associated data from the buffer memory and attaches it to the respective CIP header.

The technical problem addressed by the present application is to provide a simpler solution for performing isochronous data transmission, i.e. without the need of a selection unit performing the above mentioned functions.

1. Claim 1

The solution according to claim 1 of the international application discloses to write the isochronous data format header to a special register and to a buffer memory for bus

packets when the isochronous data transmission is set up in a data transmitting device and to attach the useful data of the bus packet to the isochronous data format header in the buffer memory.

Neither the technical problem nor the solution of present claim 1 is disclosed or suggested by one of the prior art documents cited in the International Search Report. The requirements of Article 33(2) PCT concerning novelty and Article 33(3) PCT concerning inventive step are thus complied with.

2. Claims 2-8

Method claims 2 - 5 depend on claim 1 which was found novel and inventive in the sense of Articles 33(2) and (3) PCT. Consequently, also claims 2 - 5 also meet the requirements of Articles 33(2) and (3) PCT.

Claims 6 - 8 disclose an apparatus for carrying out the method according claims 1 - 5 and thus correspond to the preceding method claims. Consequently, also claims 6 - 8 also meet the requirements of Articles 33(2) and (3) PCT.

3. Claims 1 - 8 meet the requirements of Article 33(4) PCT concerning industrial applicability.

Re Item VIII

Certain observations on the international application

The features following the term "in particular" used in present dependent claims 2 and 5 have no limiting effect on the scope of said claims. To avoid ambiguity of the claims in the sense of Article 6 PCT said term should have been avoided (see PCT Preliminary International Examination Guidelines C-III-4.6).

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

(54) Title: METHOD FOR THE COMPILATION OF BUS PACKETS FOR ISOCHRONOUS DATA TRANSMISSION VIA A DATA BUS, AND APPARATUS FOR CARRYING OUT THE METHOD

(57) Abstract: The format of the transmission of isochronous data packets via the IEEE 1394 bus is defined in the IEC 61883 Standard. A bus packet used to transmit the data has a header (1394H) at the beginning, which header describes the format of the bus packet. This is then followed by an isochronous data format header (CIPH), which defines the data format of the useful data in the useful packet. The invention is concerned with the problem of compiling a bus packet for transmission via the 1394 bus. In the case of the invention, this is done in such a way that when the isochronous data transmission is set up, the isochronous data format header (CIPH) prescribed by the application is written both to a special register (38) that is provided and to the buffer memory (32) for the bus packets and the useful data are attached thereto. As a result, it is then possible that a data transmitting section (35) has to take the data to be transmitted, including the isochronous data format header (CIPH), only from the buffer memory (32). A multiplex operation joining together the data and the isochronous data format header (CIPH) need not then be effected for the transmission of the data.

(54) Title: METHOD FOR THE COMPILATION OF BUS PACKETS FOR ISOCRONOUS DATA TRANSMISSION VIA A DATA BUS, AND APPARATUS FOR CARRYING OUT THE METHOD

(57) Abstract

The format of the transmission of isochronous data packets via the IEEE 1394 bus is defined in the IEC 61883 Standard. A bus packet used to transmit the data has a header (1394H) at the beginning, which header describes the format of the bus packet. This is then followed by an isochronous data format header (CIPH), which defines the data format of the useful data in the useful packet. The invention is concerned with the problem of compiling a bus packet for transmission via the 1394 bus. In the case of the invention, this is done in such a way that when the isochronous data transmission is set up, the isochronous data format header (CIPH) prescribed by the application is written both to a special register (38) that is provided and to the buffer memory (32) for the bus packets and the useful data are attached thereto. As a result, it is then possible that a data transmitting section (35) has to take the data to be transmitted, including the isochronous data format header (CIPH), only from the buffer memory (32). A multiplex operation joining together the data and the isochronous data format header (CIPH) need not then be effected for the transmission of the data.

Method for the compilation of bus packets for isochronous
data transmission via a data bus, and apparatus for
carrying out the method

5 The invention relates to a method for the
compilation of bus packets for isochronous data
transmission via a data bus. The invention furthermore
relates to an apparatus for carrying out the method. The
apparatus may be, in particular, part of a bus interface
10 for the connected data bus.

Prior art

 The invention is based on a method for the
compilation of bus packets for isochronous data
15 transmission via a data bus of the generic type of the
independent Claim 1. For quite a long time now the
convergence of the product sectors of consumer
electronics (hifi, video, audio) and personal computing
has been trumpeted under the catchword multimedia and has
20 actually been propelled by many manufacturers from both
camps. The merging of the two product sectors means that
work concerned with the subject of data exchange between
the equipment of the different product sectors or else
between the equipment within one product sector is
25 becoming more and more significant. This is also apparent
from the efforts for standardization with regard to this
subject, which are already well advanced. Specifically,
the so-called IEEE 1394 serial bus already provides an
internationally standardized and very widely accepted bus
30 for data exchange between terminals from both product
groups. The precise designation of the aforementioned
standard is: IEEE Standard for high performance serial
bus, (IEEE) STD 1394-1995, IEEE New York, August 1996.

 The invention that is to be described here is
35 concerned with the so-called isochronous data transfer
within the abovementioned bus system. In this connection
isochronous means that data to be transmitted arise
regularly at a data source, the data also arising with

approximately the same size each time. Examples of such data sources are video recorders or camcorders, audio devices such as CD players or DAT recorders, and also DVD players or videophone devices, etc. An international standard has been specially developed for this application of isochronous data transmission. The precise designation of this standard is: IEC International Standard 61883 "Consumer Audio/Video Equipment Digital Interface, 1st edition 1998". The first part of this standard describes the general data packet format, the data bus management and the connection management for audio visual data. General transmission rules for control commands are likewise defined.

Very frequent application relates to the transmission of MPEG2-coded video or audio data. The data are transported via the bus in packets, as already mentioned. In this case, the following structure is provided in the abovementioned Standard IEC 61883: the data generated in the data source are divided into so-called data source packets having a defined size. For MPEG2 video data transmission, for example, the standard stipulates that a data source packet is composed for example of 8 data blocks of identical size. In this case, the data block size can be programmed. It may be between one and 256 quadlets, where a quadlet corresponds to a combination of 4 data bytes. The data source packets are transmitted in one or more bus packets in accordance with the IEC 61883 Standard. A bus packet has a so-called isochronous data format header in addition to the elements of bus packet header, useful data field and CRC checksum field. The said isochronous data format header is designated as CIP header (Common isochronous packet) in the abovementioned IEC 61883 Standard. It defines the data format for isochronous data transmission, which is described in detail in the Standard and will be explained in more detail below. This isochronous data format header is called CIP header below. This CIP header is added to the beginning of each bus packet after the bus packet

header. This then ensures that the station which receives the transmitted bus packet can evaluate the data in the correct manner.

Although the CIP header largely remains constant
5 throughout the isochronous data transmission, it must nonetheless be newly updated in one section (DBC entry). Added to this, however, is the fact that during isochronous data transmission, the said CIP header has to be present twice in the bus interface, since, on the one
10 hand, a completely compiled bus packet can be sent onto the bus, while at the same time new data are provided by the application process, a new CIP header having to be created for these new data.

Owing to this difficulty, we initially considered
15 a solution internally for the compilation of bus packets in which two separate special registers are provided for the CIP headers. The useful data of the respective bus packets are provided in a buffer memory. If a packet is to be sent via the bus, then a selection unit must read
20 the correct CIP header from one of the two special registers and transfer it to the data transmitting unit at the correct point in time and then also fetch the associated data from the buffer memory and attach them to the CIP header.

25 The object of the invention is to simplify the solution described above, to be precise in such a way that the selection logic unit for joining together the CIP header and the associated useful data can as far as possible be omitted.

30 The invention achieves this object in such a way that, when the isochronous data transmission is set up, it writes the generated CIP header only to one special register and, in addition, also to the buffer memory for the useful data, in which case the useful data of the bus
35 packet are subsequently attached to this CIP header in the buffer memory (see Claim 1). What is achieved as a result of this is that, for the transmission of the data via the bus, the data transmitting section only has to

access the buffer memory for the useful data, where CIP header and useful data are stored contiguously in the correct order. The data transmitting section thus obtains the data to be transmitted only via the buffer memory. A
5 selection logic unit which determines the special register from which the CIP header has to be taken and the memory area of the buffer area from which the useful data have to be attached can be omitted.

Further improvements of the method are possible
10 by virtue of the measures evinced in the dependent claims. According to Claim 2, the CIP header may contain a comparison value for data counting. This value must be updated for each bus packet. This is done in such a way that when the data of a bus packet are written to the
15 buffer memory, the data are counted and, at the end, the comparison value, determined in this way, for the data count is updated in the CIP header, which is entered in the special register, and the updated CIP header is copied to the buffer memory at the next free location for
20 a bus packet. The data of the next bus packet would then be attached in turn to this CIP header. Consequently, the useful data for the next bus packet are again stored contiguously in the buffer memory and they can be transported from there contiguously to the data
25 transmitting section of the bus interface.

In this connection, it is advantageous if the data are counted in units of data blocks and the comparison value for the data count in the CIP header relates to the first data block in the respective bus
30 packet. As a result, the solution then conforms to the abovementioned IEC 61883 Standard, which also stipulates that the comparison value DBC in the CIP header relates in each case to the first data block of a bus packet.

The following measures which specify the way in
35 which the corresponding object of the invention is achieved are advantageous for an apparatus for carrying out the method according to the invention (see Claim 6). The apparatus comprises a buffer memory for the data of

bus packets. Furthermore, the apparatus comprises a memory management unit and a special register for a CIP header of a bus packet. The apparatus furthermore has initialization means which, when the isochronous data transmission is set up, copy the corresponding CIP header for the first bus packet both to the special register and to the buffer memory.

The CIP header for the isochronous data transmission to be set up is preferably prescribed by the application process in the transmitting station.

Also advantageous are the measures according to Claim 8, where it is defined that the apparatus furthermore has a data block counter, by which the data blocks of the isochronous data transmission are counted and whose counter reading at the corresponding point in time specifies the comparison value for the data count, which is entered into the special register in which the CIP header for the isochronous data transmission was stored during initialization. Furthermore, provision is made for the respective updated CIP header to be copied to the buffer memory, with the result that the correct CIP header is directly available again in the buffer memory for the next bus packet to be transmitted.

Drawings

Exemplary embodiments of the invention are illustrated in the drawings and are explained in more detail in the description below. In the figures:

Figure 1 shows the structure of a plurality of successive bus packets for isochronous data transmission, and

Figure 2 shows a block diagram of the apparatus according to the invention.

Exemplary embodiments of the invention

Figure 1 shows an exemplary sequence of transmitted bus packets. In the example shown, it is assumed that MPEG2-coded video data are to be transmitted

during the isochronous data transmission. For this case, the IEC 61883 Standard provides for 8 data blocks with MPEG2 video data to be transmitted per data source packet. The size of the data blocks is specified in units of quadlets in the abovementioned standard. The data block size can be programmed; to be precise, all values between one and 256 quadlets are possible. For the transmission of MPEG2 video data, the IEC 61883 Standard provides for a data block to have a size of 6 quadlets. Furthermore, it is assumed that in each case 8 data blocks are transmitted in a 1394 bus packet. This is possible according to the abovementioned standard and, in this case, all the data blocks of a data source packet can be completely transmitted in one bus packet. Figure 1 shows an exemplary sequence of transmitted bus packets. The first transmitted bus packet is illustrated at the top in Figure 1 and the second transmitted bus packet is correspondingly illustrated at the bottom in Figure 1. The precise structure of a bus packet for isochronous data transmission is specified in the abovementioned IEC 61886 Standard. Therefore, for the disclosure of the invention, reference is also expressly made to this standard.

In Figure 1, the reference numeral 10 designates the header of the bus packet. It contains the details regarding the data field of the isochronous data packet, to be precise in a number of bytes, and also further information, but this need not be discussed in any more detail below. The header 10 of the bus packet is followed by a data field. The latter extends through the area 11-19. At the end of the bus packet there also follows an area 20, in which a CRC check word is stored. A so-called CIP header is always provided at the beginning of the data field of a bus packet. CIP is the abbreviation of "Common isochronous packet". The CIP header contains a series of information items which describe the isochronous data transfer. Thus, e.g. an identification number SID of the data source is contained therein.

Furthermore, it stipulates the size of the subsequent data blocks in the bus packet. Likewise, a detail FN (fraction number) is also contained, which specifies the number of data blocks into which a data source packet is divided. As already mentioned, there are always 8 data blocks per data source packet in the case of MPEG2 video data. A further detail QPC (quadlet padding count) relates to how many padding quadlets are attached at the end of the data source packet in order to guarantee that the latter is divided into data blocks of the same size. Furthermore, an information item SPH (source packet header) is provided, which specifies whether a header for the data source packet is likewise also provided in the bus packet. Furthermore a DBC value (data block counter) is also provided. This value specifies which data block is the first data block in the bus packet referring to all the transmitted data blocks during the isochronous data transmission. Therefore, all the data blocks are consecutively numbered individually. This value practically constitutes a comparison value which can easily be used to check whether a bus packet has not been received. To that end, the received data blocks are all counted up in the receiver station. Each time a new bus packet is received, the DBC value contained therein is compared with the counted comparison value. Only if both values correspond have all the data blocks been received and no bus packet has been lost. Further information items in the CIP header include an FMT entry (format ID). This entry can be used to signal that the bus packet contains no data at all and is a so-called dummy packet. An FDF entry (format depending field) may also be defined, this being mentioned only for the sake of completeness, and also an SYT entry, which comprises a time specification for the bus packet.

The data blocks DBO-DB7 for the first data source packet SPO then follow in the subsequent areas 12-19. The entry 0 in the data area 11 is intended to indicate that the DBC value for this first bus packet is set to the

value 0, which is synonymous with the fact that the first data block in this bus packet has the number 0. The DBC value is automatically set to this value during the initialization of the isochronous data transfer. This will be explained in more detail below. This must, of course, also be taken into consideration for the comparison count. Therefore, the comparison count likewise begins at 0.

The next bus packet again contains 8 data blocks. In this case, they are the 8 data blocks DB0-DB7 of the second data source packet SP1. This may also be followed by further bus packets which are likewise constructed in the manner illustrated.

The relevant parts of a bus interface for the invention are illustrated in Figure 2. These components are parts of a data link layer circuit within the IEEE 1394 bus interface. The reference numeral 30 designates an I2C interface, to which an I2C bus 38 is connected. Via the I2C interface, the IEEE 1394 bus interface can be configured e.g. for isochronous data transmission. The necessary control data are prescribed by an application process via the I2C bus 38. The I2C interface 30 is connected via an internal bus 41 to further components of the bus interface. The reference numeral 32 designates a buffer memory for the data exchange. This buffer memory 32 is managed by the memory management unit 31. In other words, the memory management unit 31 divides the memory in such a way that the incoming and outgoing data are correctly forwarded to the components which each access the memory. The entire address control thus takes place with the aid of this memory management unit 31. It also serves as a bus master for the internal bus 41 and allocates it to the connected units by time division multiplexing.

Furthermore, an AV transceiver unit 33 is connected to the internal bus 41. This unit is in turn connected to a data bus 39, via which all the incoming and outgoing data are relayed to and from the

application. The AV transceiver unit 33 also comprises a DB counter 37. This DB counter counts up all of the data blocks received from the application. In accordance with the IEC 61883 Standard, this counter is an 8 bit counter.

5 As a further component, a register unit 34 is also connected to the internal bus 41. The said register unit also contains the already mentioned special register for the CIP header.

10 Further components which are also connected to the internal bus 41 relate to a data transmitting circuit 35 and a data receiving circuit 36. These circuits are connected to the physical layer IC of the 1394 bus interface. Their function, in the case of the transmission of data via the 1394 bus, is to take the
15 corresponding bus packet data from the buffer memory 32 and forward them in the correct order to the physical layer IC. A further task of the data transmitting unit 35 is to perform the CRC check and to attach the corresponding CRC check data at the end of a bus packet.
20 In the case of the 1394 bus, a separate CRC check is provided for the data in the 1394 header of the bus packet. This is likewise handled by the data transmitting unit 35. The data receiving unit 36 has corresponding tasks, namely CRC checking of a received bus packet
25 separately for the 1394 header and for the useful data, and the extraction of the useful data from the bus packet and the forwarding of these data to the buffer memory 32.

 The method of operation of the apparatus will now be explained in more detail below. If an isochronous data
30 transfer is requested by the application process, the following takes place. The bus interface is initialized via the I2C interface 30, all the units being prepared for the isochronous data transmission. In particular, the CIP header for the isochronous data transmission, which
35 header is prescribed by the application with the corresponding values, is entered on the one hand into the special register 38 and on the other hand at the first free location in the buffer memory 32 for a bus packet.

It should be mentioned here that the DPC comparison value in the CIP header is set to 0 on account of the initialization. Equally, the counter reading of the DB counter 37 is also reset to 0 as a result of the initialization. Furthermore, the entry for the 1394 header is written to the 1394 header special register 39. This entry depends on the entries in the special register for the CIP header 38. Since the 1394 header does not change throughout the isochronous data transmission, it is not absolutely necessary to transfer this 1394 header simultaneously to the buffer memory 32 as well. Specifically, it is possible to adopt the corresponding 1394 header from the special register 39 each time a bus packet is transmitted. After the 1394 bus interface has been set up for the isochronous data transfer requested, the useful data are supplied by the application via the bus 41. The AV transceiver unit 33 forwards the incoming data in corresponding memory words to the buffer memory 32. The integrated DB counter 37 counts up the data and is incremented each time a complete data block has been forwarded to the memory. The size of the data block is, after all, entered in the special register 38 and the DB counter 37 was set accordingly during the initialization process. After 8 data blocks have then been written to the buffer memory 32, the DB counter 37 outputs a control signal, whereby its current counter reading is transferred to the special register 38, to be precise at the location for the comparison value DBC. At the same time, this signal informs the memory management unit 31 that it should copy the updated CIP header in the special register 38 to the next free location for a bus packet in the buffer memory 32. Afterwards, further useful data can then be written to the buffer memory 32 via the AV transceiver 33. At the same time as new data are being written in, however, the data of the preceding bus packet can be output onto the 1394 bus via the data transmitting unit 35 and the physical layer IC. The memory management unit 31 allocates the internal bus 41 to the various

components by time division multiplexing. In this case, the internal bus 41 is designed in such a way that it can satisfy the bandwidth requirements of the individual components. After all, there is the added fact that via
5 the data receiving unit 36, too, they may enter requirements for forwarding received data into the buffer memory 32, so that the bandwidth requirements of the latter must also be satisfied.

The fact that the CIP header for a bus packet to
10 be transmitted resides in each case at the beginning of the assigned memory area for this bus packet in the buffer memory 32 ensures that when the bus packets are transmitted, first of all access can be made to the special register 39, where the 1394 header of the bus
15 packet is stored, and then all of the further data can be taken from the buffer memory 32. This operation is simple to carry out and a relatively complicated switching logic arrangement is not necessary for this purpose.

Various adaptations and modifications of the
20 exemplary embodiments described are possible. The structure with the various internal bus lines and bus lines provided for the external components, as described, may be chosen differently. Parts of the explained apparatus may also be realized by software. The invention
25 is not restricted to use with the IEEE 1394 bus mentioned. It can also be used for other wire-based bus systems or else for a wire-free bus system.

Claims

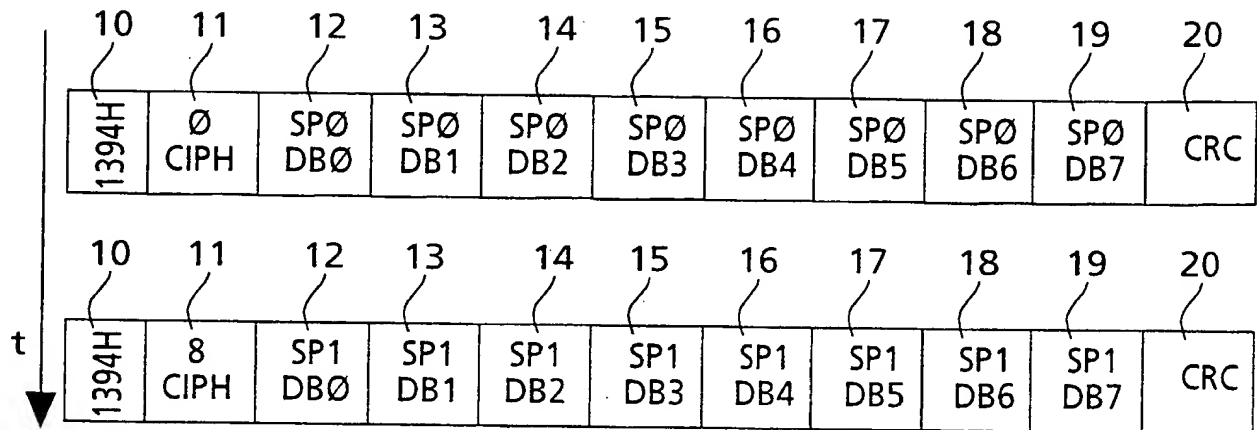

1. Method for the compilation of data packets for isochronous data transmission via a data bus, called bus packets below, the data format for the isochronous data transmission being defined in an isochronous data format header (CIPH) of the bus packet, characterized in that when the isochronous data transmission is set up in a data transmitting device, the isochronous data format header (CIPH) is written both to a special register (38) and to a buffer memory (32) for bus packets, and in that the useful data of the bus packet are attached to the isochronous data format header (CIPH) in the buffer memory (32).
2. Method according to Claim 1, in which the isochronous data format header (CIPH) contains a comparison value for data counting, in particular data block counting, in which, when the data of a bus packet are written to the buffer memory (32), the comparison value for data counting in the isochronous data format header (CIPH), which is entered in the special register (38), is updated, and in which, after the completion of a bus packet in the buffer memory (32), the updated isochronous data format header (CIPH) is copied to the buffer memory (32) at the next free location for a bus packet.
3. Method according to Claim 2, in which the data are counted in units of data blocks (DB0-DB7), and in which the comparison value for counting data in the isochronous data format header (CIPH) relates to the first data block (DB0) in the bus packet.
4. Method according to one of Claims 1-3, in which the same number of data blocks (DB0-DB7) is always selected per bus packet.

5. Method according to one of the preceding claims, in which the data to be transmitted are divided into data source packets (SP0, SP1), and in which, in particular for the transmission of MPEG2 video data, a data source
5 packet (SP0, SP1) is composed from 8 data blocks (DB0-DB7).

6. Apparatus for carrying out the method according to one of the preceding claims, having a buffer memory
10 (32) for bus packets, having a special register (38) for the isochronous data format header (CIPH) of a bus packet, and having initialization means (30), which copy the isochronous data format header (CIPH) for the first bus packet of the isochronous data transmission to the
15 special register (38) for the isochronous data format header (CIPH) and the buffer memory (32).

7. Apparatus according to Claim 6, in which the isochronous data format header for the first bus packet
20 is prescribed for the initialization means (30) by an application process.

8. Apparatus according to Claim 6 or 7, which furthermore has a data block counter (37), by which the
25 data blocks (DB0-DB7) of the isochronous data transmission are counted, and in which a memory management unit (31) is provided, which transfers the counter reading of the data block counter (37) after the counting of the data blocks of a bus packet to the
30 isochronous data format header (CIPH) stored in the special register (38), and copies the isochronous data format header (CIPH) that has been updated in this way in the special register to the buffer memory (32) at the beginning of the next free location for a bus packet.
